Subject: Unable to compile inside VPS

Hi all,

I'm getting started with openvz so I'm a bit lost with it, so I hope you can help me.

This is the situation:
I create an VE with centos 4.4.
The hardware node has this kernel "2.6.18-8.1.8.el5.028stab039.1" and it's a centos 4.5 server.

The problem is the following:

I created successfully the VE but unfortunatelly I tried to compile a tar.gz file that I need but I don't have any gcc compiler inside the VE.
I found out that inside the yum configuration file there is a restriction on it, glib is excluded from any installation so I don't want to remove it from it.

I know that there is a devel-ce4 package built by Swsoft which can be installed into a VE based on Virtuozzo in order to allow gcc compiler into this VE, but I don't find any package similar to this for openvz.

I would like to ask you if some of you either has been able to compile inside a VE or has been able to build a template like that.

thanks in advance

Best Regards,

David

what restriction do you mean?
all you need is to do:
yum install gcc

> I know that there is a devel-ce4 package built by Swsoft which can be

devel package just include binutils/gcc and some other devel rpms.
the installation is still done via yum (in case of EZ templates).

after you have installed gcc inside VE, you can create a template
cache from this VE. template cache can be used later to create new
VEs already with preinstalled packages you want (in your case -devel).

Thanks,
Kirill

Hi all,

It's solved the problem,

there was an error on my yum.conf file which had this line on it
"exclude=glib*" and so that I wasn't able to install with you any gcc
package. After removing this package everything went ok.

Thanks a lot for your help,

David
