Hi there,
I am running openvz with hypervm and it was working fine, but now none of my vm`s are not working i can not access them, when i go to thier ip address`s i just get the servers root apache page.
I tried to start the vms via hypervm control panel but i get this error?

Failed to get Status from localhost. Server said:
no_kernel_support_for_openvz_check_if_right_kernel
()

i have checked /etc/grub.conf and its set to default=0

also if i try to connect to the server via command access in hyper vm i get this error!

Unable to open /dev/vzctl: No such file or directory
Please check that vzdev kernel module is loaded and you have sufficient permissions to ac
cess the file.
I recon its a problem with openvz

any ideas please? It was fully working, i had 2 vps servers running one with cpanel and had sites resloved to it and another with centos base install on it? all working perfect.
kind regards,
Rick
