Hi, I am using the following steps to create a VPS using pre-created template. All goes fine except for a warning error message I get when I start the VPS as show below. Wanted to know if that is normal or what can/should I do not to get the warning error. See warning error in BOLD below.

Quote:ovz:/var/lib/vz/template/cache# vzctl create 101 --ostemplate debian-4.0-i386-minimal --config vps.basic
Creating VPS private area: /var/lib/vz/private/101
Performing postcreate actions
VPS private area was created
ovz:/var/lib/vz/template/cache# vzctl set 101 --onboot yes --save
Saved parameters for VPS 102
ovz:/var/lib/vz/template/cache# vzctl set 101 --hostname shell.opensourcedemo.com --save
Saved parameters for VPS 102
ovz:/var/lib/vz/template/cache# vzctl set 101 --ipadd 192.168.1.1 --save
Saved parameters for VPS 102
ovz:/var/lib/vz/template/cache# vzctl set 101 --numothersock 120 --save
Saved parameters for VPS 102
ovz:/var/lib/vz/template/cache# vzctl set 101 --nameserver 192.168.1.253 --save
Saved parameters for VPS 101
ovz:/var/lib/vz/template/cache# vzctl start 101
Starting VPS ...
VPS is mounted
Adding IP address(es): 192.168.1.1
vps-net_add WARNING: Function proxy_arp for eth0 is set to 0. Enable with 'sysctl -w net.ipv4.conf.eth0.proxy_arp=1'. See /usr/share/doc/vzctl/README.Debian.
Setting CPU units: 1000
Set hostname: host.domain.com
File resolv.conf was modified
VPS start in progress...
ovz:/var/lib/vz/template/cache#

Also, whe I enter this command:
ovz:/var/lib/vz/template/cache# vzctl set 101 --numothersock 120 --save

The --numotehrsock value 120... What is this value for? I don't quite understand its usage and is the value an average? What is the min/max value for this?

Appreciate any replies to help clarify above for me - Thanks!

Joe
