Subject: 2 eth interfaces on hardware node, need to access them both in vz's

Hello all,

I'm new to the list so please forgive my noobiness.

I have a host node that has 2 ethernet devices each connected to a seperate subnet. (1 subnet is an internal net, the other is the internet).
I need to let each of the vz's see both networks and default to routing out the internet interface.
I have scoured the docs, but everything I've read so far talks about having 3 interfaces all on the same subnet?

Does anybody have any ideas how I can do this?

Thanks in advance.
