Subject: private area on NFS export

Hi,
I am currently trying to use a NFS Server
to share the private area between different
HNs.
I am using debian etch with systs.org repo
(tried fza and standard kernel-image).
I am using standard debian kernel as nfs host.
It seems possible to get VEs working, but
'df -h' cant show root file system simfs.
Also apt-get wont run because of a statvfs error
('No such Device', if I remember correctly.
I want to know if this is a nfs or openvz specific
problem, and if somebody else encountered the same problem.
are there any recommendations to share private data
between Hosts? Are there other (simple to manage)
network-filesystems that are usable?
I am trying to share private areas to minimize
migration time.

Thanks and best regards, Moritz.
