Subject: domain names / virtual machines

here's a scenario:

two domain names: a.com and b.com
one ip for the HW node: 1.1.1.1
two VMs, 100 and 101

if I want to have any traffic from a.com go to VM 100 and any traffic from b.com go to VM 101, what are the options?

Should I run an apache reverse proxy from the HW node or another VM? or are there any other solutions?
