Subject: Debian 6 with OpenVZ crashes

Hi @all,

I've installed Debian 6.0.4 with 2.6.32-5-openvz-686 Kernel on my HP DL760 G2. My CTs work really fine, but sometimes the hole box stalls and you have to switch off and on.

I reduced the memory to 16 GB, but the same problem appears. It also doesn't look like a hardware problem, because the unpatched Debian kernel and ESXi runs without any problems.

I also have ssh sessions which showed me:
top: no heavy load
messages: no entries
user_beancounters: no entries

After rebooting the box everything is fine again until the next crash.

Are there some more logs to look for the error?

Thanks
Daniel
