Hello,

Why cpulimit doesn't work?
I created the container with cpulimit 40(of quad core processor).
Launched stress in it and the main's server cpu consumption were 100% of all cores, load averages ~200. How I understand it must be only ~10%..

I have installed it "apt-get install cpulimit"
kernel: 2.6.26-1-openvz-686
