Subject: *SOLVED* Samba server in VE

Hi, and thanks for a great, easy to use, virtualization system!

That is, it was easy to use until I found the need for broadcasting packages with samba. After reading up on veth, I managed to create such a device, as well as configure it using the wiki. It still wont broadcast packages though, according to another post here in the support forum I need to create a bridge on the host, adding both the veth as well as the physical interface.

Creating the bridge is okay, but once I add the physical interface (eth0) to it, connectivity breaks. The servers screen is filled with "veth102.0 recieved a package from its own address" messages.

My setup is very simular to the one presented in
http://forum.openvz.org/index.php?t=tree&th=1218&mid =6813&&rev=&reveal=
, the only thing I seem to be missing is a clearer explenation on how I perform the resolving step?
