Subject: Memory limits in active VE - refreshing info in VE system?

Hi,
I'm setting memory limits in active VE. Everything works OK, settings appears immediately in /proc/user_beancounters.

But the question is if I should also see extended/decreased parameters when I run 'free' command? I do see old parameters until I reboot the VE.

Is it a way to refresh this in free and/or cat /proc/meminfo output?
