Subject: World cannot see the containers's services

I installed OVZ in debian etch. Everything went fine, but I am experiencing the problem.

The machine is like this:

Internet--->GW Firewall -->> OVZ HN---> Containers

GW Firewall (ipchains) specified public IP (11.22.33.44) and the OVZ HN has another public IP (55.66.77.88), and Containers have private IPs. I tried to assign public IPs to Containers, but could not get into the net. I have almost gone thorough everything under the networking in the wiki, but without avail.

I want to use the server for virutal shared webhosting, but could not succeed, only because neither the world sees the containers, nor containers reach the internet.

Anyone who is running a virtual hosting share their firewall configuaration how they accomplish. I tried the firewall at the openvz wiki as well as the one at fridu.org, but without success.

Inputs and hints appreciated. Thanks!
