Subject: vzctl enter CT via SSH (wrapper?)

My VPS provider allows me to SSH into the host node to get to my VE, and I was just wondering how that is done so I can duplicate the functionality on my local install of OpenVZ (as its handy when you've locked yourself out of your VE by flushing iptables or stopping sshd or something!)

Basically I SSH into the host node with a username and password and it seems to perform a "vzctl enter <veid>" as I get the prompt:

entered into CT 102
root@vps:/#

Like you do with "vzctl enter 102".

Is this a built-in function of OpenVZ, or is it some sort of hacky wrapper such as replacing the shell of my HN user with "sudo vzctl enter 102" or something?
