Hi!

I've a real big problem since i've upgrade from RHEL5 2.6.18-059.6 to 2.6.18-062.3 Kernel. As an information use this Kernel with Debian Etch.

Since i've upgraded the kernelmodules seems to be loaded in a random order.

Sometimes my 3ware Controller is 1. hostcontroller then sometimes my onboard serverworks chipset. Same with the networkcards. eth0 - eth4 are mixed up after every reboot.

I haven't seen this behaviour with the earlier kenerls.

Stefan
