hello team?

I'm just newbee here in openvz, we use centos 5 and successfully installed the OpenVZ. also weinstalled the control panel which is vtonf..

We followed this link http://www.howtoforge.com/managing-openvz-with-vtonf-control-panel-on-centos-5.2

Our problem is, we cannot access the IP address 192.168.0.100:8001
Upon we installed the vtonf the fooloeing appears:

Vtonf control panel installation completed. Please login to the control panel from the following information
http://192.168.0.100:8001/

Is this the default IP? or this will have other IP address to be appear?

I try to access the control panel in other pc, but its not able.

In server itself, we can use the control panel but not the way in accessing the ip address above instead we type http://localhost:8001

Thanks....
