Hello,

I will help you this time, but I want to notice, that your question is not OpenVZ related. Therefore this is not the right place where to ask such questions. So, don't be offended on lack of answers on your post.

I will explain everything, assuming that you use RedHat/CentOS. For other distributions it should not be much different. So, if iptables is installed on your node, you should create file /etc/sysconfig/iptables with the following contents:

```
# Generated by iptables-save v1.2.11 on Mon Feb 12 13:04:04 2007
*nat
:PREROUTING ACCEPT [1033:152955]
:POSTROUTING ACCEPT [6:649]
:OUTPUT ACCEPT [5:589]
-A PREROUTING -d 192.168.3.184 -i eth1 -p tcp -m tcp --dport 22 -j ACCEPT
-A PREROUTING -d 192.168.3.184 -i eth1 -j DNAT --to-destination 10.0.0.5
-A POSTROUTING -s 10.0.0.5 -o eth1 -j SNAT --to-source 192.168.3.184
COMMIT
# Completed on Mon Feb 12 13:04:04 2007
# Generated by iptables-save v1.2.11 on Mon Feb 12 13:04:04 2007
*mangle
:PREROUTING ACCEPT [18349:1826391]
:INPUT ACCEPT [17920:1776389]
:FORWARD ACCEPT [17:3326]
:OUTPUT ACCEPT [7922:1202714]
:POSTROUTING ACCEPT [7939:1206040]
COMMIT
# Completed on Mon Feb 12 13:04:04 2007
# Generated by iptables-save v1.2.11 on Mon Feb 12 13:04:04 2007
*filter
:INPUT ACCEPT [17920:1776389]
:FORWARD ACCEPT [17:3326]
:OUTPUT ACCEPT [7922:1202714]
COMMIT
```

192.168.3.184 - IP address of HN

10.0.0.5 - IP address of VE

22 - port, which sshd is running on. According to your message it is 8091 for you.

Then do

service iptables restart

For further information read manuals on netfilter.org
