Hello,

I've several nics on the hostnode. Only the internal service nic have an internal IP. The other nics are without IPs and connected to different internal subnets and public www.

I've read the differences between venet and veth
http://wiki.openvz.org/Differences_between_venet_and_veth
and want to use venet, but only venet0 is active in the hn, I think this is connected to eth0, but how to access the other nics?

Thanks
Daniel
