Hi All,

I'm doing some research on processing virtual machine recently.

As I what know now, I think OpenVZ vps runs the same OS kernel as the
host system.
The vps is a group of processes which are forked on the host system.
In the OpenVZ container, thera are some processes to run an os.
Is it possible to run only one App in the container instead of the os
based on the host os? such as a media player?
what are work should I need to do mainly?
could you give me some suggestion?

Thanks.

Tommy
