Subject: Centos 5.8 Very resolve speeds

I feel that the login speed and yum update speed if very slow on my openVZ VPS with centos 5.8, the container has dedicated 4 cores (only VPS on the system)

on the actual server it can do yum update extreamly quickly, but on the VPS on the same server the yum update and logging into SSH through putty seem very sluggish, also when downloading from cachefly there is a long resolve time with a very fast download (80~MB/s). Been trying to install virtualmin but when it goes to download some files it says timeout error, but when i copy the link it trys to download and wget it, after waiting for resolve it downloads nearly instant as it should. So until i can get this fixed i wont be able to install Virtualmin

Any ideas on what could be the cause?

here is a video to demonstrate it: http (:)//www (.) youtube.com/watch?v=OJQ5yvGowZc
