View Forum Message <> Reply to Message

Hi, I have developed a fully functional web based control panel to administrate the backend of OpenVZ. The program will be listed under GNU and should be starting the 1st downloads soon. I am waiting for OpenVZ blessing 1st before I officially offer the download link. In the mean time, here are some screen shots.

<< EDIT >>

Ok, happy downloading!

Requirements:
* Apache 1.3.34
* PHP 4.4.2
* gcc

How to install Apache + PHP follow this link:
http://www.lamphowto.com/lamp.htm

Download OpenVZ Control Panel follow this link:
http://scripts.blurstorm.com/index.php?id=downloads

<< /EDIT >>

Once we start downloading, I welcome feedback and bug reports as well as other programmers (php mainly) who want to make this better. More will be talked about this once OpenVZ blesses the program.

Robert

File Attachments

I would like to request the owner of OpenVZ to contact me at robert@blurstorm.com so I may send you the source files for the program listed in this thread. I sent an email to the mystory email but not sure who that actually goes to.

Thanks, correcting a few items and adding some small other features. I forgot about the different templates so that won't be hard to add. Other then that, I will probally post the download Thursday. Just also wanted to give OpenVZ time to respond because I want them to support this 3rd party software or more like bless it.

Thanks,

I will release it soon for downloading. Also, I want to make some test cases so looking specifically for people who are running x86_64 linux. I know it works fine in 32 bit.

Also, I will need test cases for the following OS installed on the hardware node once released:

Fedora (version)
CentOS 4 (works)
FreeBSD
RHEL 3
RHEL 4
CentOS 4 x86_64
RHEL 4 x86_64
RHEL 3 x86_64

Any other main hardware node OS? Anyhow, if people running these could update the post that was once it is released I can get some status back a week or so later for you to test.

Thank you !!!!!
i been try the scrip the page look ok
but vps don't create or
is back to same page
==========

1. Edit /etc/sudousers ( no exist )
2. Add the following:

root ALL=(ALL) NOPASSWD: ALL
nobody ALL=(ALL) NOPASSWD: ALL

NOTE: SECURITY NOTE: The VPS Node is designed not to run any users. DO NOT USE THIS SOFTWARE if you have users running on your
VPS NODE! This is a potential security hazard IF you have users on the hardware node.

3. Edit settings.php and change the path to vzctl and the path to where the php scripts are installed.

4. chmod 777 ip-database.txt

5. Edit .htaccess and create your password file
>> .htpasswd -c /.htpasswd username

6. Visit the URL to where you installed the program and enjoy.

please help i am last step ! my life !!
regards you are the best god blees you !

Create VPS:

If no errors, Linux OS was just created

Set VPSID 151 onboot = yes

Added 192.168.1.222 to VPSID 151

Added hostname localhost.com to VPSID 151

Set root password as demo for VPSID 151

I just started VPSID 151, you should now be able to shell into 192.168.1.222 using user root and password demo

but vps not create
i check vzlist --all
not show
==========
note php.ini change << great tips >>
please help me to run the Great control panel >>>
god bless you !!!!!!!

View Forum Message <> Reply to Message

yes i been service httpd restart
after fill the information
Create VPS:

If no errors, Linux OS was just created

Set VPSID 111 onboot = yes

Added 192.111.111.232 to VPSID 111

Added hostname 1111.com to VPSID 111

Set root password as admin for VPSID 111

I just started VPSID 111, you should now be able to shell into 192.111.111.232 using user root and password admin
i check bash command
vzlist --all
no vps found
and i create manual
like
vzctl create 101 --ostamplate centos4 ***** is work ok
or fedora ok
another tip to check
god bless you !!!

check your template cache directory and make sure the templates spelling match to those in create.php

Has anybody else been able to get this working on there server?

Subject: Re: New OpenVZ Web Based Control Panel
Posted by jbond007 on Thu, 02 Feb 2006 16:37:20 GMT
View Forum Message <> Reply to Message

have the same
$bin/vzctl create $id --ostemplate centos-4-i386-default

i using bash command
[root@localhost vzserver]# vzctl create 122 --ostemplate centos-4-i386-default
Creating VPS private area: /vz/private/122
Performing postcreate actions
VPS private area was created
[root@localhost vzserver]# vzlist --all
VPSID NPROC STATUS IP_ADDR HOSTNAME
122 - stopped - -
[root@localhost vzserver]#
template is ok i try all centos and fedora using bash
if you like i send the test demo server ssh ip and login

Not to sound like an ass, but if you can't figure out the common things the scripts are doing, much less configure sudo, you don't need to be runnig them

i doubt he released this to be bottle feeding people wanting to us it.

find you a howto on SUDO and fix that, as thats the problem.

Hi, it appears you do not have a complete install on your server.

I executed one of the php scripts from shell and received the following errors:

No log handling enabled - turning on stderr logging
Cannot find module (IP-MIB): At line 0 in (none)
Cannot find module (IF-MIB): At line 0 in (none)
Cannot find module (TCP-MIB): At line 0 in (none)
Cannot find module (UDP-MIB): At line 0 in (none)
Cannot find module (HOST-RESOURCES-MIB): At line 0 in (none)
Cannot find module (SNMPv2-MIB): At line 0 in (none)
Cannot find module (SNMPv2-SMI): At line 0 in (none)
Cannot find module (NOTIFICATION-LOG-MIB): At line 0 in (none)
Cannot find module (UCD-SNMP-MIB): At line 0 in (none)
Cannot find module (UCD-DEMO-MIB): At line 0 in (none)
Cannot find module (SNMP-TARGET-MIB): At line 0 in (none)
Cannot find module (NET-SNMP-AGENT-MIB): At line 0 in (none)
Cannot find module (HOST-RESOURCES-TYPES): At line 0 in (none)
Cannot find module (LM-SENSORS-MIB): At line 0 in (none)
Cannot find module (IPV6-ICMP-MIB): At line 0 in (none)
Cannot find module (IPV6-MIB): At line 0 in (none)
Cannot find module (IPV6-TCP-MIB): At line 0 in (none)
Cannot find module (IPV6-UDP-MIB): At line 0 in (none)
Cannot find module (SNMP-VIEW-BASED-ACM-MIB): At line 0 in (none)
Cannot find module (SNMP-COMMUNITY-MIB): At line 0 in (none)
Cannot find module (UCD-DLMOD-MIB): At line 0 in (none)
Cannot find module (SNMP-FRAMEWORK-MIB): At line 0 in (none)
Cannot find module (SNMP-MPD-MIB): At line 0 in (none)
Cannot find module (SNMP-USER-BASED-SM-MIB): At line 0 in (none)
Cannot find module (SNMP-NOTIFICATION-MIB): At line 0 in (none)
Cannot find module (SNMPv2-TM): At line 0 in (none)

I did the same from several other machines and produced no errors.

My sugestion is for you to do a standard server install for the hardware node using CentOS 4.2

I can not further investigate this unless multiple people are seing this but I do not think that is the case.

View Forum Message <> Reply to Message

What version you run the script?
Or OpenVZ Kernel
My system RUN centos 4.2 Minimal install
php* httpd*

All Vz packets

vz command work ok
vzctl create delete
What you recommend to test your script
I been try all

OpenVZ users please try install this script
And report success install ASAP
Max

View Forum Message <> Reply to Message

The kernel does not matter with the problem you are having. There are modules missing from your server. Please do a server install (not min) of CentOS 4.2 then report back.

what version of apache are you running? I was thinking this could be a apache 2 issue. I am running 1.34xxx or whatever the 1.x latest version is. I am also upgrading the kernel now on another VPS server I admin that is not in production right now and will post my results shortly. This server I installed from hand using standard CentOS 4.2 server.

i run the last yum update apache 2
i check the create.php is look like skip tar create vps
i use webmin running processes to check live
i found that vzctl create has bug !
is not template name or location
sudo -u root vzctl create $id --ostemplate centos-4-i386-default"

if i try vzctl create 112 --ostemplate centos-4-i386-default
work perfect
script bug
about apache
try install
centos 4.2
php
apache
Help! Us
your project are good idea

View Forum Message <> Reply to Message

Ok, I set this up on another server using the latest kernel and it works fine.

This is not a control panel issue, I think it could be the level of apache you are running.

View Forum Message <> Reply to Message

Bad news i been install all apache 1.3 and the same problem
vps
Create VPS:

If no errors, Linux OS was just created

Set VPSID 1212 onboot = yes

Added 192.168.1.129 to VPSID 1212

Added hostname 1111.com to VPSID 1212

Set root password as admin ID 1212

I just started VPSID 1212, you should now be able to shell into 192.168.1.129 using user root and password admin
but not create any vps
i run apache 1.3

Help!!

follow the instructions for adding php to your apache config

Subject: Re: New OpenVZ Web Based Control Panel
Posted by jbond007 on Fri, 03 Feb 2006 17:08:16 GMT
View Forum Message <> Reply to Message

Dear this good Manual ? for php install

1. gunzip -c apache_1.3.x.tar.gz | tar xf -
2. cd apache_1.3.x
3. ./configure
4. cd ..

5. gunzip -c php-5.x.y.tar.gz | tar xf -
6. cd php-5.x.y
7. ./configure --with-mysql --with-apache=../apache_1.3.x
8. make
9. make install

10. cd ../apache_1.3.x

11. ./configure --prefix=/www --activate-module=src/modules/php5/libphp5.a
(The above line is correct! Yes, we know libphp5.a does not exist at this stage. It isn't supposed to. It will be created.)

12. make
(you should now have an httpd binary which you can copy to your Apache bin dir if it is your first install then you need to "make install" as well)

13. cd ../php-5.x.y
14. cp php.ini-dist /usr/local/lib/php.ini

15. You can edit /usr/local/lib/php.ini file to set PHP options.
Edit your httpd.conf or srm.conf file and add:
AddType application/x-httpd-php .php

View Forum Message <> Reply to Message

well, yes it is in-secure but with these conditions it does not pose a threat to me.

1. There are no users on the hardware node
2. The Control Panel is protected with a htpasswd
3. Everything operates inside the htpasswd directory

Of cource, with later releases these security issues will be talked more and dealt with using other means.

for everyone who cant sudo;

add a line to your /etc/sudoers;
apache ALL=(ALL) NOPASSWD:ALL

where "apache" is owner of your httpd processes.
