Hi everyone!
I have installed openVZ on my FedoraCore-5-x86-64 system, everything works , it booting, creating vps, starting, but created vps not ping from out or inside!
I use fc-5-minimal template, iptables on system (main system) are off on installation.
i have add 2 virtual eth interfaces 10.0.0.3, 10.0.0.4, physical is 10.0.0.2,i have added ip 10.0.0.3 to vps 3 (vzctl set 3 --ipadd 10.0.0.3 --save) i start my vps veid 3 (vzctl start 3) it started and running but i can't connect to vps's ssh by 10.0.0.3,it connects to system shell not to to vps!
when i enter to vps (vzctl enter 3) and try to ping anything it not pinging, even 10.0.0.2 is not pinging...
i tryed to stop iptables on vps (service iptables stop) but it write error "no modules loaded" or "no modules found"

Please help!
