free -m & physpages reports around 37MB of RAM used, while privvmpages shows ~190MB of RAM, I know kmemsize reports something but what is that in? Is that included in the privvmpages?

Here is my user_beancounters

[root@web01 /]# cat /proc/user_beancounters

Why is there such a difference between physpages and privvmpages?

Thanks in advance,
Devon

Hello,

There is a great page http://wiki.openvz.org/Privvmpages#privvmpages
where the meaning of all UBC parameters are explained.

Vasily.
