Subject: Network / shared storage support on VZ7

Hello everyone,

I'm thinking about upgrading from openVZ 6 to openVZ 7 and I need to know if is it possible now to install VEs on a shared storage ? (It was possible but migration had some issues).

Typically, if I have a VE installed on a SAN partition (mounted on /vz/private/UUID), and want to migrate it to another node using this same partition. Will oVZ7 understand this situation now as it is performed now by CRIU mechanism and not the old method ? (before openVZ complained about the file system was mounted on another host and the migration wasn't possible).

Thanks.
