Hi,
I would like to use veth device on a VM1 to be able to capture even frames which are not designated for veth. I am using tcpdump in the VM1 and I can capture only broadcast and the frames with destination HW address same as the HW of veth device. I tried to set veth device into promisc mode but it didn't work. Is there any chance how to grab all the traffic?

My host machine is Debian 6.0 and the VM1 is Debian 5.0 both working on 2.6.32-5-openvz-686.

Best regards,
Ori
