Does the OpenVZ kernel allow for auditd to run inside a container?

I can't seem to get it to start, and I'm wondering if it's because it's OpenVZ.

I found some references that seem to indicate there is an issue, but all of those are back in 2009 and 2011. I wasn't sure if those ever got resolved or if people just stopped trying to get auditd running in an OpenVZ container.
