I'd like to bump this issue.   We're running 2.6.18-ovz028test007.1-smp, and seeing lots of the same message.

High traffic box, but not particularly high cpu.

A problem we're seeing alot is if any vz hits it's tcprcvbuf limit, and failcnt's on that parameter, the entire box (hw node) will not accept any tcp connections (i.e., ssh into my hardware node), and has to be bounced.

Anyone seen similar issues, regarding tcp sockets in any way, and how you might have tuned this better?
