I'm trying to get ipv6 working with centos 6.2 and vzkernel 042stab042.1

ipv6 on the host works. Within a container I can not ping outside, I've tried several ipv6 howto's, but still no luck. Has anyone a working configuration with Centos 6.2 (because of the vwap feature) or should I try Centos 5 with a 2.6.18 vzkernel or debian?

Update: I've reinstalled the host with Centos 5.7 and the latest 2.6.18 stable vz kernel, now ipv6 works great within the containers

my sysctl.conf:
net.ipv6.conf.all.forwarding=1
net.ipv6.conf.default.forwarding=1

#MG: enable ipv6 forwarding for containers
net.ipv6.bindv6only=1

PS the latest 2.6.18 vz kernel has also the vswap feature.
