Hi,

I am sorry if this question has been asked over and over again. I had installed a CentOS machine with an IP 192.168.1.130 and installed OpenVZ. Then i proceed to create a VE and gave it an IP 192.168.1.151. Everything went smoothly and I tried to connect to the VE remotely but host is not reachable. I am able to ssh into the VE from 192.168.1.130. Do i need to set a gateway or anything?

Thank you.

```
[root@VPS1 ~]# vzlist -a
      VEID      NPROC STATUS  IP_ADDR         HOSTNAME
       101         16 running 192.168.1.151   pridns.test.com
```

Sorry to answer my own question. Simply edit /etc/sysctl.conf and its done.

Thanks

could you please show output:

from HW node:
ip a l
ip r l

from VE:
ip a l
ip r l
