Subject: List all OpenVZ Runtime Parameters

Hi ,

I have been trying out openvz for my learning and wanted to check if there is a command which can be used to list all the Resource parameters being used in runtime with their current values.

something similar to "sysctl -a"

This data would also help me serve as a backup in case i configure something wrong using "vzctl set".

I would appreciate a response.

Thank you,
vmk

'cat /proc/usr_beancounters' may help, I guess.
