Hello all..

I'm trying to config and follow wiki:Nat but cant go far..

Actually i wanted to do

- VE0 - sshd,vz,yum
- VE1 - httpd,ftpd,etc
- VE2 - MySQL
- VE3 - Mail
- VE4 - DNS

in one public ip. Each VEs with services will be private ips. In wiki:Nat saying that iptable set in HN but the iptable service couldnt start up. I used REHL2.6.9 Stable kernel.

If i couldnt distributed each services on each VEs, i've to throw everything to one one box. That's not so nice since i wanted to use VEs power..

Or should i use veth to config DHCP on VE??

And is there anyway to Virtual:Virtual cluster/heartbeat in one physical hardware??

Pls help i'm dying.. sleepless nights....

--thanks

Hello,

We need more information to help you. For example what's the problem with starting iptables service? What do you see on screen,
may be in logs?
Quote:... the iptable service couldnt start up.

Have you set IP adresses of VEs using --ip_add option of vzctl?
I'm just a little bit confused, when you've said about DHCP...

Waiting for additional information!

wut i meant to DHCP is through veth.. but accordingly wiki, venet is preferred. so need to set up on HN.

thanks
