Hello,

I am installing OpenVZ on a new server i have in Meridian Gate London, UK.

Got around to installing it tonight to be greeted by this, i'm not exactly fluent in recompiling kernel's and my testing has been done on an IDE drive which is fine.

Can anyone explain how i can make this work and how to get the drivers working for this SATA Drive;

```
[root@alpha /]# rpm -ihv
http://download.openvz.org/kernel/022stab064.1/ovzkernel-2.6.8-022stab064.1.i686.rpm
Retrieving
http://download.openvz.org/kernel/022stab064.1/ovzkernel-2.6.8-022stab064.1.i686.rpm
warning: /var/tmp/rpm-xfer.oUb40j: V3 DSA signature: NOKEY, key ID a7a1d4b6
Preparing...                ########################################### [100%]
   1:ovzkernel              ########################################### [100%]
WARNING: No module sata_sil found for kernel 2.6.8-022stab064.1, continuing anyway
WARNING: No module sata_via found for kernel 2.6.8-022stab064.1, continuing anyway
```

Chris,

hello

you should ignore this warning message it's harmless. Or do you have specific issue?

regards,
Aistis

Sorted it now

I just commented the line's out in /etc/modprobe.conf for the SATA devices, installed the kernel,

uncommented the lines again and rebooted, worked fine

These warnings are due to the fact we have these modules builtin in kernel, i.e. we have no modules
simply ignore this warnings, it installed kernel successfully.

Sata and OpenVz work perfect

i use centos 4.2 openVz ent. + regular adaptect sata controller chipset silicon Image
work great
and i setup raid software
vz partition raid 5
great
