========== vzctl(8) ==========
--capability capname:on|off

Sets a capability for a container. Note that setting capability when the container is running does not take immediate effect; restart the container in order for the changes to take effect. Note a container has default set of capabilities, thus any operation on capabilities is "logical and" with the default capability mask.

You can use the following values for capname: chown, dac_override, dac_read_search, fowner, fsetid, kill, setgid, setuid, setpcap, linux_immutable, net_bind_service, net_broadcast, net_admin, net_raw, ipc_lock, ipc_owner, sys_module, sys_rawio, sys_chroot, sys_ptrace, sys_pacct, sys_admin, sys_boot, sys_nice, sys_resource, sys_time, sys_tty_config, mknod, lease, setveid, ve_admin.
