Hi guys,

I'd like to know what packages are required by openvz. For instance, do I need apache installed?

I'm using the Fedora Core 5 kernel-2.6.16-1.2111_FC5.026test012.i686.rpm

I can boot into Fedora perfectly fine but booting into the OpenVZ kernel causes all sorts of errors with symbols all over the screen lol.

Should I switch to the stable kernel?
