I want to install yum in a VE from the HN and issue this command:

vzyum 134 install yum

vzyum checks dependencies and ends this way:

Transaction Summary
 ==
================
Install   83 Package(s)
Update   0 Package(s)
Remove   0 Package(s)
Total download size: 67 M
Is this ok [y/N]: y
Downloading Packages:
warning: rpmts_HdrFromFdno: V3 DSA signature: NOKEY, key ID 443e1821

Public key for coreutils-5.2.1-31.4.i386.rpm is not installed

The public key for centos4-base is installed in HN and VE. So WTF?

BTW: this is not a new HN. There are several VEs which were updated for a year now.

HN is CentOS 4-4.2, VE is centos-4-i386-default

I edited /vz/template/centos/4/i386/config/yum.conf and replaced gpgcheck=1 with gpgcheck=0. Now I get this:

Transaction Check Error: file /sbin/nash conflicts between attempted installs of dummy-centos-4-1.0-3.swsoft and mkinitrd-4.2.1.8-1

Then I removed the vztmpl and reinstalled them. I removed the caches with vzpkgcache -r and recreated them with vzpkgcache -f. The above error message keeps coming up.

You can remove dummy-centos-4 from the list of packages (/vz/template/centos/4/i386/config/*list) and rebuild cache with -f.

Alternative variant is to rebuild dummy-centos-4 rpm, either removing nash from it, or my adding "Provides: mkinitrd" to it. Do not forget to increase the version. I have attached a spec file, please edit accordingly, rebuild, put binary rpm to /vz/template/centos/4/i386/vz-addons/ and run createrepo there. After that you can try to recreate template cache.

File Attachments
1) dummy.spec, downloaded 430 times

I tried your first suggestion. This is the error message from vzpkgcache -f:

--> Running transaction check
--> Processing Conflict: kernel conflicts dev < 3.2-7
--> Finished Dependency Resolution
Error: kernel conflicts with dev < 3.2-7
ERROR: yum failed with 1 exit code
