Hi,

I am designing a small custom VPS panel for my VPS hosting business.
I wanted to use the VPSs IP at a particular port to load the Servers Control Panel

e.g. Tthe IP 88.88.88.88 is the VPS IP and 77.77.77.77 is the servers main ip
My control panel files are on the main server at /usr/local/panel/

I want to load the panel from the URL:
https://88.88.88.88:8888

These should load the files from the main server at /usr/local/panel/

Virtuozzo does it. So how is this going to be possible ?
Do I have to use IP tables and NAT to do it :
http://wiki.openvz.org/Using_NAT_for_container_with_private_ IPs

I am a newbie at this so please help me.

Regards,
Rick

Please help me someone.

Will this do the trick :
iptables -t nat -A PREROUTING -p tcp -d 88.88.88.88 --dport 8888 -i eth0 -j DNAT --to-destination 192.168.0.1:8888

Whats the internal IP of the server is it 192.168.0.1 OR 10.0.0.0

Please help someone. I have spent nearly a week trying to figure this out.
