I get this error:

```
root@hera:/usr/src# vzyum 1000 update
```

```
exec /usr/share/vzyum/bin/yum -c /vz/template/fedora-core/4/i386/config/yum.conf --installroot
```

```
/vz/root/1000 --vps=1000 update
```

There was a problem importing one of the Python modules
required to run yum. The error leading to this problem was:

```
No module named cElementTree
```

Please install a package which provides this module, or
verify that the module is installed correctly.

It's possible that the above module doesn't match the
current version of Python, which is:

2.4.1 (#1, Apr 10 2005, 22:30:36)

[GCC 3.3.5]

If you cannot solve this problem yourself, please send this
message to <yum@lists.linux.duke.edu>.

I know just about nothing about Python. The VPS 1000 is just a fresh new VPS made from the
OpenVZ stock Fedora Core 4.
