Subject: *SOLVED* error: "kernel.sysrq" is an unknown key

I'm getting this error on startup & during sysctl -p.

It seems to be preventing my VPS from connecting to any IP other than that of the HN.

I've installed OpenVZ on Gentoo. The kernel .config file is attached. I've triple-checked the options described here, so I'm not sure what I'm missing.

Thank you for your time,
Jonathan Guilbault.

This may just be my own idiocy. The compiled kernel definitely down not have CONFIG_MAGIC_SYSRQ enabled. It's set in another kernel.

I've got so many lying around I must have gotten confused.
