Subject: *SOLVED* How do I use vztmpl-centos-4-2.0-2.i386.rpm?
Posted by JimL on Wed, 21 Feb 2007 15:50:56 GMT

I have successfully installed from source an openvz kernel on Ubuntu, and am now trying to get a VM running from a template. I was successful at copying a running VM from FC6 into /vz/private so I know I'm almost there, however...

When I install vztmpl-centos-4-2.0-2.i386.rpm and then attempt to create a vm, with:

vzctl create 300 --ostemplate centos-4

I get

Cached os template /vz/template/cache/centos-4.tar.gz not found

Sure enough, /vz/template/cache is empty. And if I look at the rpm I don't see it putting anything in the cache.

The rpm puts files in /vz/template/centos/4/i386/config and /vz/template/centos/4/i386/vz-addons.

I also tried vzctl create 300 centos, without any success.

How do I create a vm from the info in /vz/tmeplate/centos?

THanks,
Jim.
