Hi,

TUN/TAP seems to be non-functional.
After following the steps found on:

wiki.openvz.org/VPN_via_the_TUN/TAP_device

I still get an error on the VPS when giving the command "modprobe tun" : FATAL: Could not load /lib/modules/2.6.18-194.17.1.el5.028stab070.7/modules.dep: No such file or directory

Anyone got any good suggestion for this?

Thank you for your time and efford.

It is not possible to enable the module from inside the VPS, you will need to ask your Provider to enable the module on the host node and enable it for the VPS.

Thanks
