Hi,

There seems to be almost double the privvmpages usage displayed in 2.6.9 compared to the same vps running on 2.6.8. Is this change documented somewhere? These are the figures I get:

barebones centos-4 vps on 2.6.8 kernel shows privvmpages as (amounts to about 18MB)

privvmpages	4545	7262	11520	11520	0
dcachesize	78057	81774	2147483646	2147483646	0

the `_same_` vps running on 2.6.9 shows (amounts to 40MB, more than double)

privvmpages	9491	10752	11520	11520	0
dcachesize	0	0	2147483646	2147483646	0

From the above, should I assume that now privvmpages includes dcachesize too?

Thanks.
