Hello,

It will be perfect, you'll post here:

- 1) full .config file you used, while compiling OpenVZ kernel in use
- 2) Your backup-script. Having it in hand we will be able to produce the same stress test locally and probably reproduce the crash.

It will be great, if you can set up a remote console and press magic keys while next crash  
([http://wiki.openvz.org/Remote\\_console\\_setup](http://wiki.openvz.org/Remote_console_setup) [http://wiki.openvz.org/Magic\\_SysRq\\_Key](http://wiki.openvz.org/Magic_SysRq_Key))

Also you can compile OpenVZ kernel with official configs from [openvz.org](http://openvz.org) and check, is the problem reproducible with such kernels.

Thank you,

We appreciate you help very much,

Vasily
