Hi All,

I setup an openVZ server and installed 2 VEs there. All is good except one thing: there is no swap available for VEs. On parent server all looks ok:

```
==============================================
# free
             total       used       free     shared    buffers     cached
Mem:       4141608    3834984     306624          0     178040    3095728
-/+ buffers/cache:     561216    3580392
Swap:      4096564          0    4096564
==============================================
```

but on VEs it's not:

```
==============================================
# free
             total       used       free     shared    buffers     cached
Mem:       4141608     485956    3655652          0          0          0
-/+ buffers/cache:     485956    3655652
Swap:            0          0          0
==============================================
```

So the question is: how can I setup swap for VEs?

Thanks in advance for any help.

Hello,
check this links will help you to understand
(http://wiki.openvz.org/UBC_systemwide_configuration#Memory_a nd_swap_space)
and
(http://wiki.openvz.org/Setting_UBC_parameters)

and to hide your UBC
vzctl set CTID --meminfo none --save --setmod restart

regards
Alaa Eldin

Hi Alaa,

thanks much, that helped a lot! I read the documentation before posting here but not carefully enough so missed the right section.
