Subject: ipTables - SSH

Hi There

I've followed the procedures outlined at http://wiki.openvz.org/Setting_up_an_iptables_firewall to configure an ipTables firewall for my server. However, I would like to know how to alter the script to do the following. I don't have a permanent IP address at home and so can't set up the DMZ address. How can I open port 22 for SSH inbound and outbound from any source/destination in the above script?

Kindest Regards
Tom

your system has a local network IP that you can fix and use

Thanks for your reply

Sorry, but the machine running OpenVZ is located in a datacentre and therefore it is not part of my local network.
Any other ideas?

Thanks
Tom
