I can't setup more than 16 MB to Xcache on VPS with Centos 5. I need incrase this value on sysctl.conf but I don't know which.

[root@cambiarhost ~]# sysctl -a |grep shm
kernel.shmmni = 4096
kernel.shmall = 268435456
kernel.shmmax = 4294967295

root@cambiarhost ~]# sysctl -a |grep mmap
vm.flush_mmap_pages = 1

It is a limitation by Kernel?
Thanks!!!!

Interesting, I have a strange "2" failcnt on shmpages. Im going to increase this value and then check if I can increase memory of Xcache.

Update: yeah, you are right! It was a issue related with shmpages, thanks
