Hello,

agree about udev. But is it correct to have private/ID/dev normally populated?

I am afraid but I can not quickly give access to the HW node.
You mean by ssh?

I packed the vps but my public space it's not wide enough can I ftp somewhere?

About the:

```
# vzctl set <veid> --features sysfs:on --save
```

what you mean by "does it work now?". I still can't ssh to it.
I can vzctl enter it. But it was my fault previously reporting this as not working, I forget to report this in previous post, apologies.

tb
