There is something wrong with one of my vpses, i'm getting errors if my diskspace would be all used.
Like if i try to install something via yast i get "The disk space is nearly exhausted. Continue with the installation?"
My FTP daemon refuses to reacieve files issuing "Disk full" error."
user_beancounters fail counters all are 0s.
df as you know shows only tmpfs inside vps.
It seems its vps specific - other vpses doest have this "dissease"...

The problem was DISKSPACE in vps config
