Hello,

In the changelog for vzctl 3.0.24 i found the new features: nfsd

I expect that this is NFS Server Support inside a Container. Is there any stuff i should be aware of when i turn this on? Has anybody tried this already? Is this feature already stable?

thx,
Christian

After i set the features nfs and nfsd to on, i tried to install
apt-get install nfs-kernel-server

in a ubuntu lucid CT to test if kernel-nfs server is supported now as it seems to be but all i got is:

nfsd[112]: nfssvc: No such device

Any hints?

thx,
Christian

I'm testing the same thing and receiving an identical error message in a CentOS 5.4 container.

Hopefully someone has had some success with this.
