Thanks to Vasily precious help, the problem is corrected!  
There are two critical points:  
The script /vz/sysconfig/vz-scripts/120.mount must have the "-n" option, like:

```
#!/bin/bash  
/bin/mount -n --bind /nova /vz/root/120/teste  
exit $?
```

But the unmount script (/vz/sysconfig/vz-scripts/120.umount) **MUST\_NOT\_EXIST!**  
I forgot that everything is unmounted during a shutdown.  
Even with the "mount -n" option if the unmount script is used, we have problems after some more "start/stop".
