the server is getting this error when it attempts to boot the openvz kernel.

request_module: runaway loop modprobe binfmt-464c

It looks to me like there is an issue with this being made for 32bit systems

Ok, if I understand correctly, you have a 64-bit server, running 64-bit CentOS 5.5.

The error you get when trying to start the vz service is normal, since you have an openvz kernel installed, but you are not running it. According to 'uname -a', you're running the standard CentOS kernel.

Is there a reason why you have installed a 32-bit ovzkernel-ent instead of the 64-bit ovzkernel?

If there is no special reason, you should:

yum remove ovzkernel-ent
and then:
yum install ovzkernel.x86_64
Then check the settings in /boot/grub/grub.conf so that the proper kernel is set as default and reboot.

Thanks my mistake.

Now I'm trying to install ovz panel

http://code.google.com/p/ovz-web-panel/wiki/Installation

Ran auto installer with no errors:
wget -O - http://ovz-web-panel.googlecode.com/svn/installer/ai.sh | sh

But, it says:

Starting services...
Starting OpenVZ Web Panel
=> Booting WEBrick...
=> Rails 2.2.2 application started on http://0.0.0.0:3000
[2011-03-10 20:47:31] INFO WEBrick 1.3.1
[2011-03-10 20:47:31] INFO ruby 1.8.5 (2006-08-25) [x86_64-linux]
Starting watchdog daemon...
Starting the daemon...
Syncing physical servers state...
Adding localhost to the list of controlled servers...
Panel should be available at:
http://server1.host.com:3000

However, I wish to access via IP like
http://ipaddress:3000

I went there, page not found.

This control panel is a 3rd party application, you'll probably get quicker and better help directly from them.
