You are right, thats buggy, there's no way, without error using the vzctl util to "remove" device settings from config file.

The "q" Option is not documented, it add a group execute grant to dev-node only, the /dev/vz/devperms shows:

```
# vzctl set <VEID> --devices b:8:18:q --save
# cat /proc/vz/devperms
[...]
101 b 010 8:18
```

```
# vzctl set <VEID> --devices b:8:18:none
# cat /proc/vz/devperms
[...]
101 b 000 8:18
```

without restarting :

first revoke the access with option "none", and remove manually related device settings in VEID config file.

(also entry in /dev/vz/devperms exist, with perm 000)

or remove manually device settings and restart VE
