Hi,

When I try and run vzpkcache I'm getting the following :

Creating cache for centos-4-i386-default OS template  
/usr/share/vzpkg/cache-os: line 193: 12770 Floating point exception\$YUM \$YUM\_CMD  
ERROR: yum failed with 136 exit code  
Creating cache for centos-4-i386-minimal OS template  
/usr/share/vzpkg/cache-os: line 193: 12862 Floating point exception\$YUM \$YUM\_CMD  
ERROR: yum failed with 136 exit code

If I alter the cache-os to print the yum commands I can see :

Creating cache for centos-4-i386-default OS template  
/usr/share/vzyum/bin/yum --installroot=/vz/root/100001 --vps=100001 -c  
/vz/template/centos/4/i386/config/yum.conf -y install ed basesystem coreutils openssh-clients  
openssh-server bind libstdc++ perl gdbm libgcc readline httpd less

/usr/share/vzpkg/cache-os: line 193: 12770 Floating point exception\$YUM \$YUM\_CMD  
ERROR: yum failed with 136 exit code  
Creating cache for centos-4-i386-minimal OS template  
/usr/share/vzyum/bin/yum --installroot=/vz/root/100001 --vps=100001 -c  
/vz/template/centos/4/i386/config/yum.conf -y install ed basesystem coreutils openssh-clients  
openssh-server less vim-minimal iptables rpm crontabs gzip passwd rootfiles sudo tar tmpwatch  
dummy-centos-4 vzdev MAKEDEV

/usr/share/vzpkg/cache-os: line 193: 12862 Floating point exception\$YUM \$YUM\_CMD  
ERROR: yum failed with 136 exit code

This is on centos4.2 and I get the same result with either the fedora or centos templates... Any ideas?

The quirks of this system are that it's an AMD64 but running a 32bit version of CentOS and it's behind a web-proxy (I've tried setting http\_proxy & the proxy config in /vz/template/fedora-core/4/i386/config/yum.conf etc).

Billy.
